CASE STUDIES

Delivered ERP and ordering-portal projects

Two projects with dated baselines, stated measurement methods and named client contacts.

AT A GLANCE

Two projects, measured against recorded baselines

Apex Logistics APAC

Supply chain ERP and API integration

June to November 2024 (6 months)

24.0 days	Partner onboarding cycle
1,420	Orders per month
99.1%	Data accuracy

OmniTrade Enterprise

B2B wholesale ordering portal and ERP integration

September 2024 to January 2025 (5 months)

12.5 min	Quote request to pick ticket
0.3%	SKU error rate
$630k	Order value processed

Each figure is tied to a baseline date, an audit date and a source. Details on the following pages.

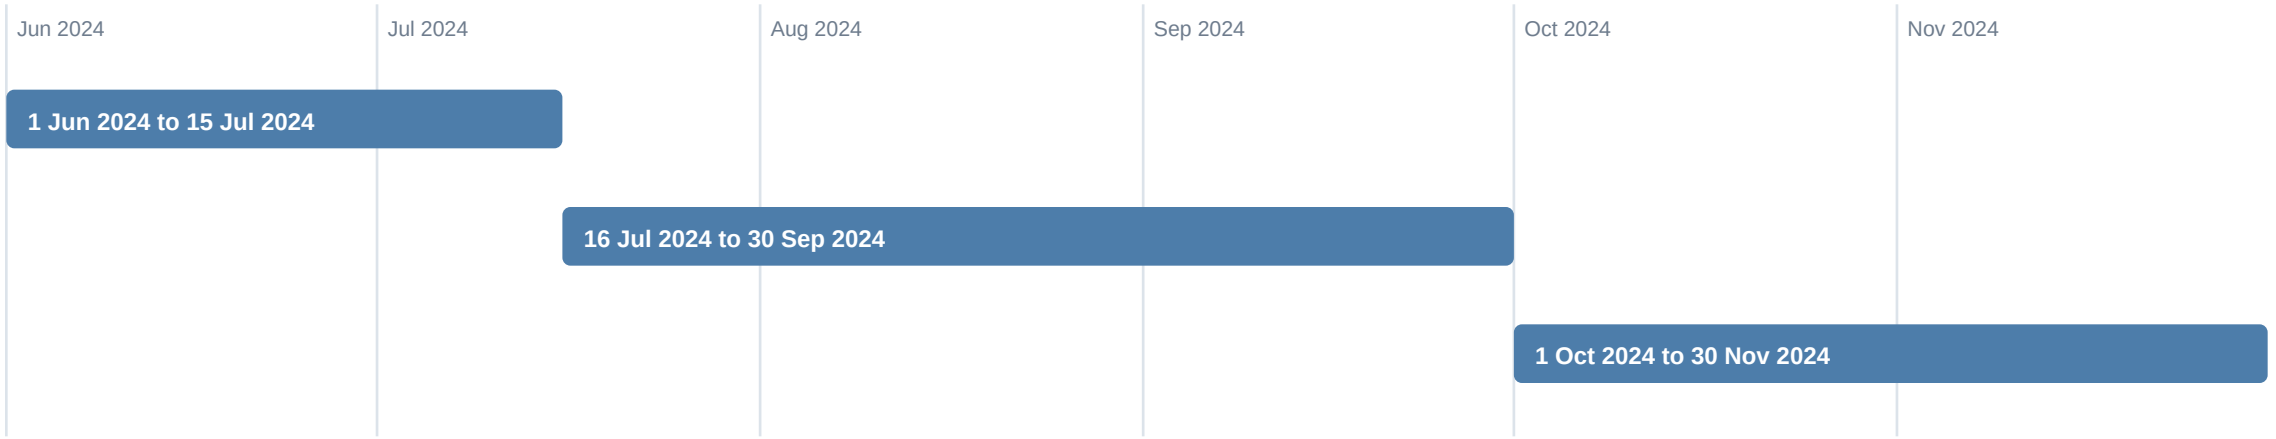
The problem

Partner onboarding relied on manual document checks across separate legacy databases in Singapore and Johor. A baseline audit on 28 May 2024 measured an average of 42.5 business days from partner document submission to ERP profile activation, from internal timestamp logs.

Scope: Supply chain ERP and API integration

Client: Cross-border distribution across Singapore, Malaysia and Indonesia

What we built, and when



Discovery and schema mapping	Mapped legacy databases; designed unified REST endpoints linking SAP inventory nodes to partner portals.
Portal and automated verification	Built a vendor-facing ordering portal with OCR trade licence verification.
Staged rollout	Deployed across 34 active regional distributors.

Measured results

Onboarding cycle

24.0 days

Partner onboarding cycle

Baseline 42.5 days (28 May 2024)

Source: SQL audit logs, 25 Nov 2024

1,420

Orders per month

Across 34 active distributors

Source: Automated ERP order logs

99.1%

Data accuracy

Source: Automated multicurrency cross-check

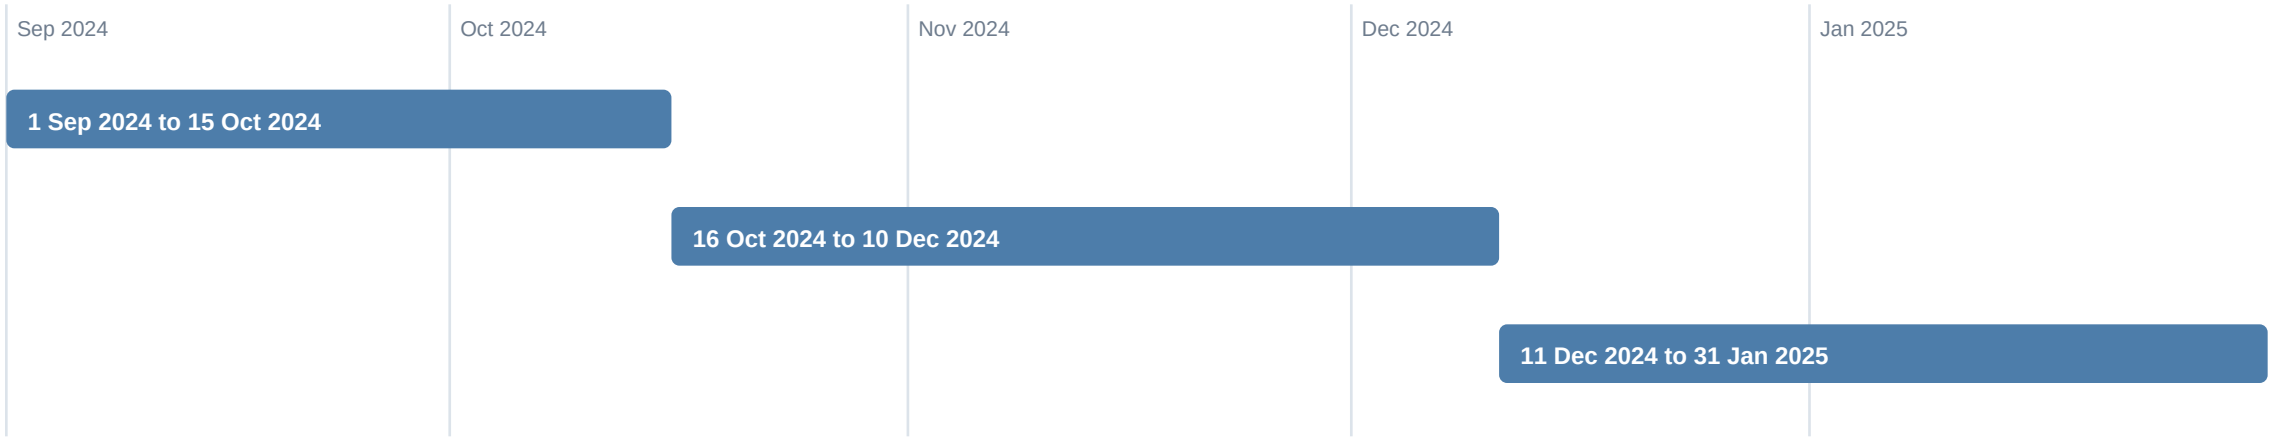
The problem

OmniTrade handled over 800 bulk orders a month by phone and emailed attachments, causing stockouts and order discrepancies. A baseline on 20 August 2024 recorded 36 hours from quote request to warehouse pick ticket and a 7.4% manual SKU transcription error rate.

Scope: B2B wholesale ordering portal and ERP integration

Client: Industrial hardware and raw materials supplier across Southeast Asia

What we built, and when



Architecture and ERP integration	Built bi-directional API middleware between the on-premise inventory database and a new ordering portal.
Portal and tiered pricing	Role-based ordering with volume pricing tiers, credit-limit checks and automated tax calculation.
Pilot launch and audit	Onboarded top-tier industrial clients; audit on 28 Jan 2025 confirmed processing under 15 minutes.

Measured results

Quote request to pick ticket

SKU error rate

12.5 min

Quote request to pick ticket

Baseline 36 hours (20 Aug 2024)

Source: System audit logs, 28 Jan 2025

0.3%

SKU error rate

Baseline 7.4% manual errors

Source: Pilot audit, Jan 2025

$630k

Order value processed

In the 7-week pilot window

Source: Portal order records

VERIFICATION

How these figures were measured

- Each baseline was recorded before delivery began (Apex: 28 May 2024; OmniTrade: 20 Aug 2024).
- Each result states its audit date and source: SQL audit logs, ERP order logs, system audit logs or portal order records.
- OmniTrade figures cover the pilot with top-tier clients, not the client's full order volume.
- Client quotes are published with written client approval.
- Written evidence behind any figure can be requested. You can also check our UEN on the Singapore ACRA register.
